

1.8 / Bellwether terrain + footprints

An unwallled village on stepped western banks. The arrival road and northern church rise out of the river ravine.

1.8 / Services, legibility + future routes

A compact return hub. Landmarks and inhabited thresholds guide the player; no compass waypoint dependency.

SERVICE POINTS / ROLES, NOT NEW NAMES

- S1 Kit: square-side waiting / reunion point.
 - S2 Tavern keeper: story, information, return anchor.
 - S3 Record / shrine service: history and Magic.
 - S4 Smith / artificer: mechanisms, repairs and Tech.
 - S5 River salvager: breath / climbing / endurance.
 - S6 Relic dealer: valuables and authored object choices.
- Roles may combine; target 4-7 cast, not all at once.
- Markers are staging suggestions, not locked triggers.

CONTENT ENVELOPE / READABILITY

8 village masses + small separate shrine.

Tavern hero interior; House A / B optional candidates.

Choose 2-3 interiors total; other doors read as closed.

North church and west gardens stay unmistakable.

Light pools and roof gaps lead into the central well.

Kit waits off the road; service points keep doors clear.

Woodland banks frame arrival; do not hide the hub behind arbitrary maze walls or oversized fences.

LATER CONNECTIONS / HONEST LIMITS

Abbey south and Foundry east are peer branches.

Foundry broken-bridge problem is farther east, not this optional local millrace service bridge.

Court gate requires both seals; no ridge bypass.

Treasury stays dry beneath / behind the NE ridge.

Exact future route lengths and distant visibility TBD.

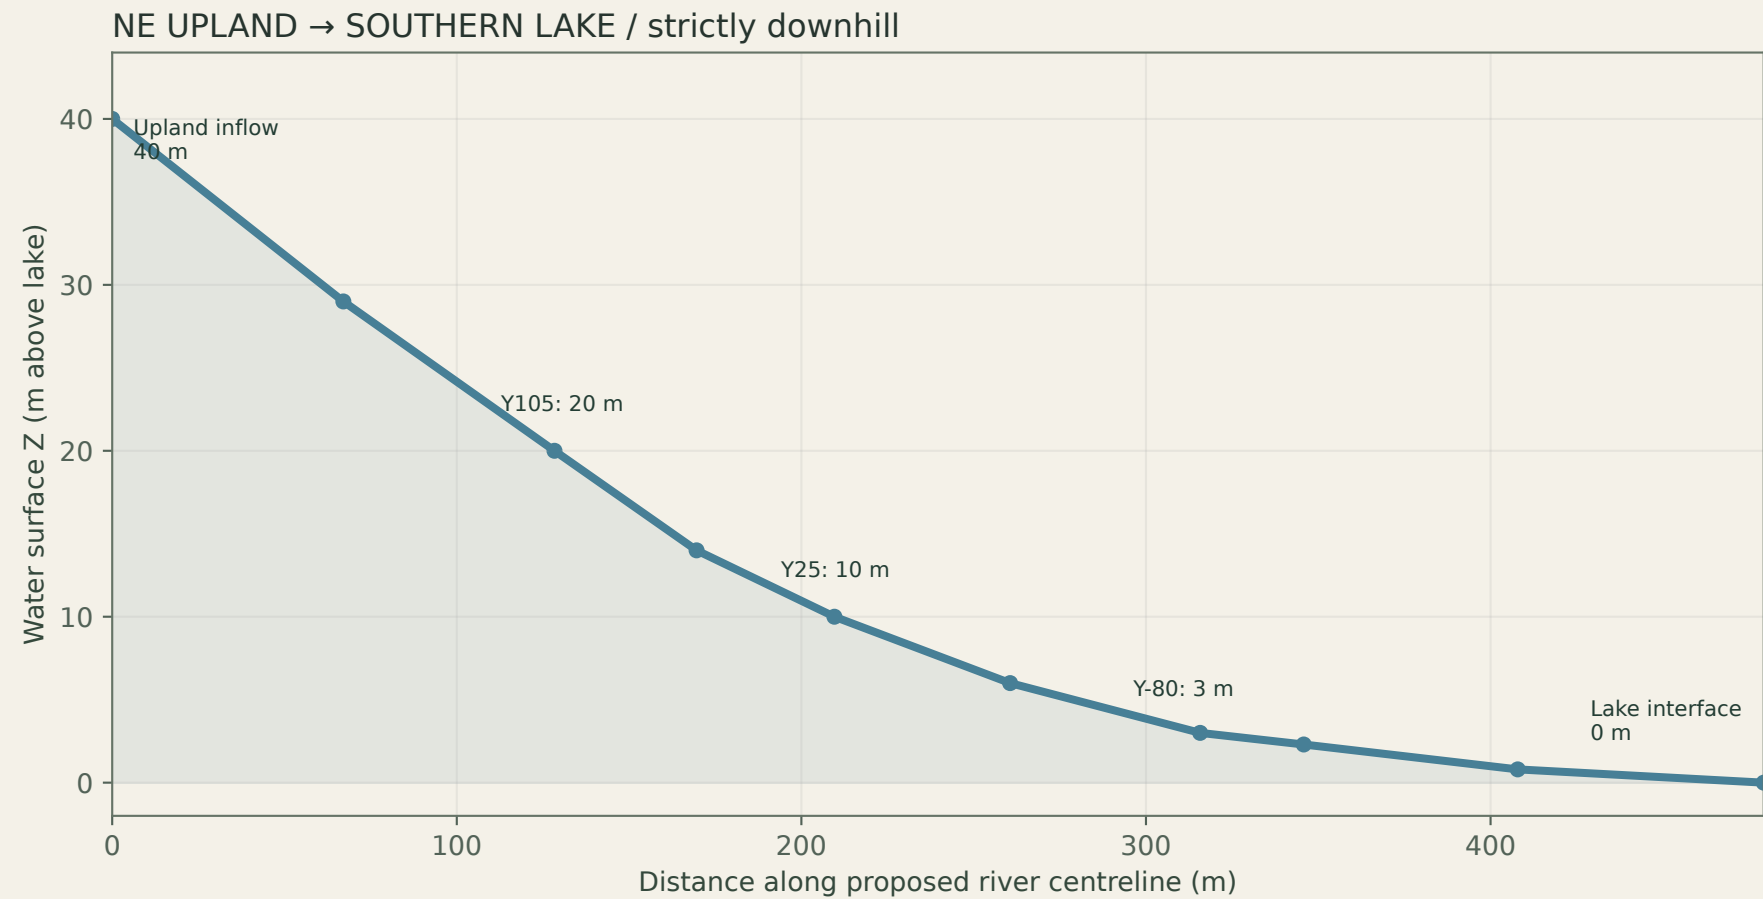

Dashed rust = desired arrival sightlines only;

Foundry / Court silhouettes require a real 3D test.

Continuity test: enter from F04, find the tavern, return to Kit, reach every admitted service, inspect the river and later gates. Then test from player-eye height with lantern, moon and foliage.

Terrain continuity / River + mill section

One shared height datum ties the upland inflow, western terraces, incised channel and future southern lake.

VERTICAL CONTRACT / PROPOSED

Well Z20.0 | lookout Z30.4 | church pad Z29.0 | mill pad Z16.0.

River runs NE → S. No uphill water segments or level river painted over a slope.

Headwater intakes, wheel drop and tailrace are modelled as different heights.

River high-water target: +1.8 m; millrace working freeboard: +1.8 m.

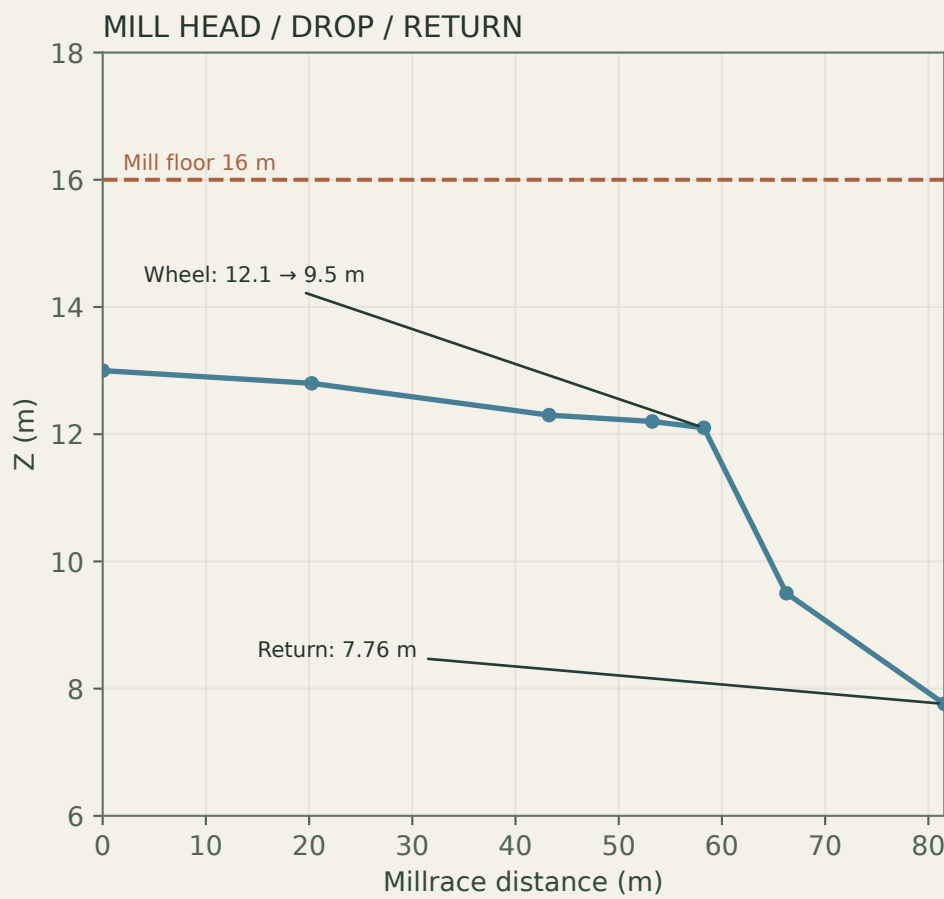

Mill floor is 3.9 m above wheel headwater; +2.1 m above its high-water target.

Local bridge: underside Z17.4; race near crossing ≈12.56 m;

clearance above proposed high water ≈3.0 m. Abutments still need blackout.

NEXT PROOF: rebuild these curves as terrain and collision, smooth junctions, retain dry pads, then walk every route with Kit.

Inspect the fixed lookout view in real 3D before detailed forest art or activating the hub. Verify phone/Windows RT cost separately.

LIMITS OF THIS REFERENCE

All numbers are authoring proposals.

Upstream / downstream reach lengths are working context, not a full-world scale lock.

Lake basin outline, outflow and Abbey floors are not designed by this sheet.

No flood simulation or bridge engineering claim.

No river crossing required for town arrival.
